Felicidades a la nueva graduada de doctorado del ICFO

La Dra. Jennifer Aldama se ha graduado con una tesis titulada 'Toward integrating continuous-variable quantum key distribution technology'

December 20, 2023

Felicidades a la Dra. Jennifer Aldama que hoy ha defendido su tesis en el Auditorio de ICFO. La Dra. Aldama obtuvo su master en Física por la University of Puerto Rico. Se unió como estudiante de doctorado en el grupo de investigación de Optoelectronics en ICFO dirigido por el profesor ICREA Dr. Valerio Pruneri.

La tesis de la Dra. Aldama titulada 'Toward integrating continuous-variable quantum key distribution technology' fue supervisada por el profesor ICREA Dr. Valerio Pruneri y el Dr. Sebastian Etcheverry Cabrera.

RESUMEN:

Being able to secure confidential information is imperative in today's society, but advancements in quantum technologies pose a potential threat. In response, researchers are developing technologies based on quantum mechanics, such as quantum key distribution (QKD), in particular continuous-variable QKD (CV-QKD), which is emerging as a promising solution due to its compatibility with classical network infrastructures. However, current systems remain bulky and costly, limiting their widespread adoption. To address this challenge, the miniaturization and integration of QKD systems into monolithic photonic integrated circuits (PICs) have the potential to accelerate adoption across a broader market. This is due to the anticipated reductions in size, power consumption, production costs and overall system complexity.

This work presents four pulsed Gaussian-modulated coherent state (GMCS) CV-QKD systems based on discrete components and, in the last case, a PIC. The thesis begins with a modular system utilizing discrete components, such as phase and amplitude modulators. Notably, this prototype eliminates the need for phase locking, as the same laser serves as both a local oscillator and the source for generating quantum signals. The system mitigates Rayleigh backscattering by employing two channels, one for transmitting light and the other for

transmitting coherent states. Demonstrations indicate its operability over metropolitan distances.

In the second approach, the system showcases the parallelization of CV-QKD signals and the coexistence of multiple quantum signals with a classical signal, spatially multiplexed through a multicore fiber (MCF). In this scenario, two lasers are employed, with one emitting the frequency locking signal propagating along one of the MCF's core.

The third proposal introduces a simplified CV-QKD transmitter (TX) that eliminates the need for a phase modulator in the GMCS generation. This system leverages the random properties of a distributed feedback (DFB) laser operating in the gain-switching (GS) mode. The study demonstrates the applicability of our proposed compact TX for GMCS generation in CV-QKD and its feasibility for integration into a metropolitan network.

Finally, we describe and characterize an InP-based PIC TX tailored for CV-QKD applications. System-level proof-of-principle experiments are conducted using a shared laser approach with a pulsed GMCS CV-QKD protocol over an 11 km optical fiber channel. The results indicate potential secret key rates of 52 kbps in the asymptotic regime and 27 kbps in the finite size regime, highlighting the capabilities of the proposed PIC design and, more broadly, the properties of InP technologies for monolithic integration of CV-QKD systems. All the proof-of-principle experiments outlined in this dissertation contribute significantly to the field of miniaturizing CV-QKD systems.

Comite de Tesis:

Prof. Dr. Maria Concepcion Santos Blanco, Universitat Politecnica de Catalunya

Dr Matteo Schiavon, Sorbonne University

Dr Laura Ortiz Martin, ETS. Ingenieros Informaticos
