Felicidades al nuevo graduado de doctorado del ICFO

El Dr. Luke Mortimer se ha doctorado con una tesis titulada " A Variety of Optimization Techniques Applied In the Context of Quantum Information Theoryi¿½

October 06, 2025

Felicitamos al Dr. Luke Mortimer que ha defendido su tesis esta manana en el Auditorio del ICFO.
El Dr. Mortimer obtuvo su Master en Fisica Teorica por la Universidad de York, antes de unirse al grupo de investigacion de Quantum Information Theory dirigido por el profesor ICREA en ICFO Dr. Antonio Acin. Su tesis titulada " A Variety of Optimization Techniques Applied In the Context of Quantum Information Theory" ha sido supervisada por el Prof. Dr. Antonio Acin.

RESUMEN:
The thesis considers a number of optimisation techniques applied in the context of quantum information theory. After a pedagogical introduction of both quantum information theory and optimisation, it considers three main avenues of research. The first is the well-known foundational open problem of mutually unbiased bases, which consists of finding sets of orthonormal bases that are each unbiased with one another. More specifically, it remains unknown whether one can find a set of 4 mutually unbiased bases in dimension 6. A variety of optimisation techniques are applied, including non-linear semidefinite programming, see-saw optimisation, semidefinite programming relaxations, branch-and-cut, gradient descent methods and the method of Lagrange multipliers, each providing further insights into the problem. The second avenue is that of Bell nonlocality, more specifically attempting to simplify the hierarchy of semidefinite programs known as the NPA (Navascues-Pironio-Acin) hierarchy used to find bounds on the maximum quantum violation of Bell inequalities. For the case in which one has a large number of inputs per party, advantage in both memory and time versus state-of-the-art solvers is demonstrated using a combination several optimisation techniques. The third avenue is that of many-body quantum physics, which encompasses a wide range of topics. The thesis considers the problems of bounding expectation values of observables over the steady-states of open quantum systems, finding improved Fermion-to-qubit mappings and solving the graph colouring problem with a novel qudit-inspired optimisation algorithm. In each case,

advantage versus comparable methods is demonstrated.

Tribunal de Tesis:

Prof. Dr. Miguel Navascues Cobo, Austrian Academy of Sciences

Prof. Dr. Darrick Edward Chang, ICFO

Prof. Dr. Victoria Jane Wright, Quantinuum
